Space Weather Forecast

Issued on Thursday, 13 July 2023 at 01:12 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: High activity with further Moderate flares (R1-R2 blackouts) expected. Slight chance strong flares. Chance G1-G2 Minor/Moderate storms day 1-2 (13-14 Jul).

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity is High, with an Moderate-class flare originating from a large sunspot region on the northeast limb. This is a large region but remains difficult to assess due to its location. More complexity is likely to become apparent as it moves into a less oblique viewing angle. A number of smaller Moderate flares have been observed from other regions on the disc, including a small region in the northwest, and two further regions in the southwest. The large and mature sunspot in the south centre disc is the other region of interest, with ongoing development around its periphery. Despite the current lack of activity from this region, its strong magnetic field gives the potential for Moderate to Strong flares.

A CME (coronal mass ejection) was produced from a filament eruption (arc of plasma) to the south of the large sunspot on the 11th July. The bulk of the material has been assessed as passing mainly below Earth, but with a likely glancing blow occurring on day 2 (14 Jul).

Solar Wind / Geomagnetic Activity: The solar wind was at slow levels throughout and varied between 290-350 km/s. Total magnetic field strength has been weak to moderate throughout, whilst the north-south component was weak. Geomagnetic activity has been at Quiet levels throughout (Kp 1-2).

Energetic Particles / Solar Radiation: No solar radiation storms were observed with the count rate of energetic particles (high energy protons) at background.

Four-Day Space Weather Forecast Summary

Solar Activity: Low to Moderate solar activity is most likely through the period, with a slight chance of an isolated Strong flare.

Solar Wind / Geomagnetic Activity: There are two glancing CMEs potentially arriving. The first associated with a Moderate flare on 10 Jul, with an arrival time of around 13/0600 UTC most likely, but confidence is rather low. A further glancing CME arrival is expected during the first half of day 2 (14 Jul) due to the filament eruption on the 11 Jul. Otherwise background solar wind is expected to become enhanced due to the arrival of fast winds from a coronal hole on day 1 (13 July). The combination of CME and coronal hole effects could lead to increased geomagnetic impacts. Geomagnetic activity is forecast to be Quiet (Kp 0-2) at first, becoming Active to G1/Minor Storm (Kp 4-5) with a small chance of G2/Moderate Storm intervals (Kp 6) day 1 (13 July). Conditions likely easing for a time, before rising again to give a chance of G1-G2 Minor to Moderate storms with the second CME glance on day 2 (14 Jul). Activity then easing to Quiet to Active days 3 and 4 (15-16 Jul).

Met Office Space Weather Forecast

Energetic Particles / Solar Radiation: Solar radiation has a slight chance of reaching the S1/Minor Storm threshold through the period, should a larger flare occur.

Geomagnetic Storms:

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	30	40	10	5
Strong	G3	No	5	10	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 M Class	Yes	60	60	60	60
Very Active	R3 to R5 X	No	20	20	10	10

Solar Radiation Storms - (High Energy Protons):

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	10	10	10	10
Very Active	≥ S3 *	No	1	1	1	1
* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
